AB . . . characteristics with polyarteritis nodosa and Wegener granulomatosis, a distinct combination of features makes it a separate entity. The presence of **asthma**, usually of adult onset, along with other **allergic** symptoms, peripheral and tissue eosinophilia, and systemic vasculitis should prompt the clinician to consider the diagnosis, seek potential confirmation with a tissue biopsy, and begin therapy to minimize complications and **prevent** permanent organ damage. The treatment of CSS has been mainly extrapolated from other vasculitides, and the literature addressing drug therapy. . .
